

North Pole Sees Temperatures 50 Degrees Above Normal

Washington, December 23 (RHC)-- In climate news, forecasters are predicting parts of the Arctic will see temperatures rise above freezing in the coming days, with temperatures near the North Pole today set to reach as much as 50 degrees Fahrenheit above normal.

The unusually warm temperatures come as Arctic sea ice levels are at a record low. Scientists say the changes would not have been possible without greenhouse gas emissions from human activity.
