

General Motors to phase out gas cars with aims to go carbon neutral by 2040

Image not found or type unknown

Detroit, January 29 (RHC)-- In the U.S., car manufacturer General Motors announced it will stop making cars that produce tailpipe emissions by 2035 as part of a pledge to become carbon neutral by 2040. GM's move to all-electric cars could cause other major automakers to follow suit.

A recent report by the Union of Concerned Scientists found electric cars generate half the emissions of the average comparable gasoline car, even when pollution from battery manufacturing is accounted for.
