

New version of toDus launched following the beta phase

Image not found or type unknown

Havana, October 23 (RHC)-- The Cuban instant messaging platform known as toDus released a new version this week, and it is no longer on a beta version.

Haniel Cáceres Navarro, the project leader of the app created at the University of Computer Sciences, highlighted as novelties of the launching the unlimited use of toDus instant messaging for as long as any of the telephone company ETECSA's data plans are active, regardless of whether the contracted data volume has been consumed.

He remarked that, with the new version, only the transfer of multimedia files will be discounted from the data package.

ToDus was launched in 2018. Since then, it has provided some 2 million subscribers with a platform adaptable to their needs, stable, and reliable.

The toDus platform responds to the need to create national applications and computer contents as part of the development of informatization in Cuba, and whose progress will provide technological sovereignty to the country and contribute to reducing the traffic of information to foreign platforms.
