A large, thick gray 'X' is drawn across a rectangular frame. The frame is composed of a thick dark gray border. The 'X' is formed by two intersecting diagonal lines of the same gray color. The intersection of the 'X' is centered within the rectangular frame. The background of the frame is white.

The World Health Organization has announced that six African nations will receive technology needed to produce their own mRNA vaccines.

Geneva, February 21 (RHC)-- The World Health Organization has announced that six African nations will receive technology needed to produce their own mRNA vaccines. The countries are Egypt, Kenya, Nigeria, Senegal, South Africa and Tunisia.

According to the WHO, the move is part of a WHO initiative to expand vaccine access and decrease dependency on wealthier nations.

The director general of the World Health Organization, Dr. Tedros Adhanom told reporters: "More than 80% of the population of Africa has yet to receive a single dose. Much of this inequity has been driven by the fact that globally vaccine production is concentrated in a few mostly high-income countries. One of the most obvious lessons of the pandemic, therefore, is the urgent need to increase local production of vaccines, especially in low- and middle-income countries."
