

Report says 50% chance global average temperature will increase over next few years

Image not found or type unknown

Geneva, May 13 (RHC)-- The World Meteorological Organization has warned there is a 50% chance average global temperatures will temporarily reach 1.5 degrees Celsius above preindustrial levels at some point in the next five years.

Climate negotiators have long aimed to keep global warming at or under the threshold, which is the equivalent of 2.7 degrees Fahrenheit.
